Complex Thinking and Transfer: Evidence and Resources

5. Complex Thinking and Transfer: Students are coached and taught to engage in higher order thinking through instructional activities and practice tasks. Curriculum, instruction and assessments are designed to prompt complex thinking, integration of concepts and ideas, and application of learned skills to new material or novel situations.

Supporting Beliefs

- Every student is capable of complex thought and transfer of learning.
- Higher order thinking promotes student engagement.
- Learning that promotes transfer of knowledge and skills prepares students for the future.

Key Traits

- Students engage in complex thinking throughout all stages of learning—from the introduction of new material to the application of what has been learned.
- Students ask and are asked questions that help them access and integrate knowledge to analyze, evaluate, and draw conclusions.
- Students are taught how to integrate and apply what they have learned within and across content areas and are given opportunities to practice.
- Students wrestle with complex and authentic problems.

Literature Supporting the Element

1. “[H]igher-order thinking happens when students engage with what they know in such a way as to transform it. That is, this kind of thinking doesn’t just reproduce the same knowledge; it results in something new…. Higher-order thinking only makes sense if to truly ‘know’ something means that you can use it and transform it.”

2. “Liberating education consists in acts of cognition, not transferrals of information.”

3. “Schools that engage low-income and minority students in deeper learning have stronger academic outcomes, better attendance and student behavior, lower dropout rates, higher graduation rates, and higher rates of college attendance and perseverance than comparison schools serving similar students.”

4. “Almost all of our teachers at Booker T. Washington were black women. They were committed to nurturing intellect so that we could become scholars, thinkers, and cultural workers—black folks who used our ‘minds.’ We learned early that our devotion to learning to a life of the mind, was a counter-hegemonic act, a fundamental way to resist every strategy of white racists colonization. Though they did not define or articulate these practices in theoretical terms, my teachers were enacting a revolutionary pedagogy of resistance that was profoundly anti-colonial.”
5. “It may seem counterintuitive to endeavor to inspire confusion, refusal and resistance in the learner, but cognitive developmental psychology and neuroscience have shown that authentic, complex, deep, and long-lasting learning seldom occurs without struggle. This is because cognitive dissonance forces a decision in the mind of the learner: ‘Do I accept the new knowledge or work to reject it?’ And if I accept it, what needs to change in the way I think about things?’ The learner’s challenge of integrating the knowledge that comes in with the knowledge already possessed forces the brain to make comparisons, weigh perspectives, consider options, evaluate plausibility, and judge merits. When the learner is compelled to make these sorts of determinations, the process activates and strengthens the most complex parts of the brain.”

6. “Newmann et al (1996) have presented three significant findings in relation to raising levels of academic achievement and intellectual quality: first, that students from all backgrounds are more engaged when classroom work is cognitively challenging than when it consists solely of conventional low-level work; second, that all students, regardless of social or ethnic background, achieve at higher levels when they participate in an intellectually challenging curriculum; and third, that equity gaps diminish as a result of engagement in such curricula.”

7. “Experimental psychologists in the last half-century have been fascinated with motivation as a prerequisite for learning. They have discovered that when we come in contact with ambiguous, complex or conflicting information, our nervous systems become aroused, amping us up and forcing us to pay attention. When we are puzzled, we find a resolution very rewarding, which sets us up for efficient learning (Berlyne, 1966; Lowenstein, 1994).”

8. “Assess higher-order thinking during all parts of instruction and assessment, both formative and summative. You can use higher-order thinking questions in many instances--oral class discussions, quizzes, exit tickets, and other classroom strategies, and tests. You can use higher-order thinking tasks in many instances as well--classroom learning activities, performance assessments, and short- and long-term projects. The most important point here is that higher-order thinking and questions and tasks should be infused throughout instruction and assessment. Don’t wait until students have memorized some facts and then ask them to reason with the facts as a second step.”

9. “Transfer doesn’t just happen as a result of a typical regimen of teaching and testing, no matter how rigorous the course of study. Transfer happens only when we aggressively teach and test for understandings that are applied in situations. As the authors of How People Learn put it: A key finding in the learning and transfer literature is that organizing information into a conceptual framework allows for greater “transfer”; that is, it allows the student to apply what was learned in new situations and to learn related information more quickly…. Transfer is affected by the degree to which people learn with understanding rather than merely memorize sets of facts or follow a fixed set of procedures; the research also shows clearly that “usable knowledge” is not the same as a mere list of disconnected facts.”

10. “Activities and assignments that promote learning tend to share certain characteristics: (1) they emphasize thinking and problem-based learning; (2) they permit student choice and initiative; and (3) they encourage depth rather than breadth.”

11. “High schools must respect adolescents more and patronize them less. The best respect is high expectations for them, and a level of accountability more adult in its demand than childlike. We should expect them to learn more while being taught less. Their personal engagement with their own learning is crucial; adults cannot ‘give’ them an education.”

12. “I wanted to become a critical thinker. Yet that longing was often seen as a threat to authority.”
